1. Work Description

Troilus Gold plans to carry out three types of exploration work in the coming year: rock outcrop examination with rock sampling (stripping/channeling), diamond drilling, and geochemical soil sampling.

Exploration work initially involves the examination of rock outcrops and mapping to characterize potential mineralogical occurrences, to better target subsequent exploration work in the field.

Next, soil samples (horizon B) will be taken from several areas of interest for laboratory analysis.

Field work will also involve stripping dead ground with a small excavator or pressure pump. Once the rock is accessible, a saw will cut lines in the rock to take rock samples for analysis by an accredited laboratory. A total of 10 to 20 stripping sites are planned, distributed among the sectors identified on the map below.

The following equipment will be used for diamond drilling:

- Land drill (1) or helicopter drill (if road access is not possible)
- Bulldozer to prepare access roads
- Fuel equipment containers
- ATV
- Pump station

Preparation work for diamond drilling will involve clearing an area 20 meters by 20 meters to make place for the equipment. This includes trees cutting and levelling the surface.

The areas will be accessible via the Troilus access road, the Route du Nord or by helicopter. The planned stripping dimensions are 10 m x 10 m (100 m²).

All workers taking part in the work will be housed at the Troilus camp, which has an authorized water supply well and a wastewater treatment system.

The camp is accessible from km 108 on the north road via a 44 km access road maintained by Troilus Gold.

Maps showing the location of the works are presented in the appendix.

2. Authorizations

If deforestation is required to carry out the work, a forestry intervention permit will be obtained from the MRNF prior to the start of the work, and the conditions listed are respected.

All exploration work must be notified to SOPFEU, indicating the sectors, dates and equipment to be used.

An authorization from the MRNF is now required for exploration work involving hydraulic machinery, such as stripping and drilling.

The work is likely to take place at more than 20 metres from hydric environments and wetlands. If work is to take place less than 20 metres from water or wetlands, a declaration of conformity will be filed with the MELCCFP, and the necessary conditions will be met.

3. Schedule

Stripping, soil and rock sampling are scheduled to take place between June and December 2025. If results are positive, additional work could be carried out in the same areas in 2026. Diamond drilling is scheduled to begin in late May 2025 and could continue throughout the year, until May 2026.

4. Protection measures

All hydraulic equipment, gasoline-powered equipment and equipment involving the use of residual hazardous materials will be equipped with an emergency spill kit in the event of a leak.

Residual materials will be sent to the landfill at the Troilus site.

Hazardous materials generated in the course of the work will be managed by the environment department and repatriated to our hazardous waste container at the Troilus site, where they will be recovered by a contractor specializing in hazardous waste management.

Exploration work will be subject to regular inspections to ensure environmental compliance of sites in accordance with authorizations received and environmental standards for exploration activities.

5. Contacts

Any questions or comments regarding environmental authorizations and follow-up measures can be addressed to the environmental coordinator at the coordinates below:

Josée De Launière

E-mail: josee.delauniere@troilusgold.com

Tel: 418-770-6317

Any questions on operations, duration of work or safety measures applied may be addressed to the site coordinators at the coordinates below:

Yannick D'amboise

E-mail: Yannick.D'amboise@troilusgold.com

Tel: 581-579-7423

Marc Tremblay

E-mail: Marc.Tremblay@troilusgold.com

Phone: 418-618-0951
